

Reminder of Key Definitions

Terms

$$\begin{array}{ll} \text{(Terms)} & M, N ::= x \mid c \mid (\lambda x. M) \mid (MN) \\ \text{(Constants)} & c ::= \text{fix} \mid Z \mid S \mid \text{pred} \mid \text{ifz} \end{array}$$

Abbreviations:

$$\begin{array}{ll} \underline{\text{id}} & = \lambda x. x \\ \underline{\text{const}} & = \lambda xy. x \\ \underline{\text{sub}} & = \lambda xyz. xz(yz) \\ \underline{\text{div}} & = \text{fix } \underline{\text{id}} \end{array}$$

Free Variables

$$\begin{array}{ll} \text{FV}(x) & = \{x\} \\ \text{FV}(c) & = \emptyset \\ \text{FV}(PQ) & = \text{FV}(P) \cup \text{FV}(Q) \\ \text{FV}(\lambda x. N) & = \text{FV}(N) \setminus \{x\} \end{array}$$

Substitution

$$\begin{array}{lll} c[N/x] & = & c \\ y[N/x] & = & y \quad \text{if } x \neq y \\ y[N/x] & = & N \quad \text{if } x = y \\ (PQ)[N/x] & = & P[N/x]Q[N/x] \\ (\lambda y. P)[N/x] & = & \lambda y. P \quad \text{if } y = x \\ (\lambda y. P)[N/x] & = & \lambda y. P[N/x] \quad \text{if } y \neq x \text{ and } y \notin \text{FV}(N) \end{array}$$

Redexes

$$\begin{array}{l} \text{pred } Z \mid Z \\ \text{pred } (S \ N) \mid N \\ \text{ifz } Z \ N \ P \mid N \\ \text{ifz } (S \ M) \ N \ P \mid P \\ (\lambda x. M) \ N \mid M[N/x] \\ \text{fix } M \mid M \ (\text{fix } M) \end{array}$$

One Step

$$C[] ::= [] \mid M \ C[] \mid C[] \ N \mid \lambda x. C[]$$

Define $M \triangleright N$ just if there is a context $C[]$ and a redex/contraction pair P / Q such that $M = C[P]$ and $N = C[Q]$.

- If $M \triangleright^* N$ then the term N is said to be a **reduct** of M .
- If $M \triangleright^+ N$ then the term N is said to be a **proper reduct** of M .
- A term M without proper reduct is a **normal form**.

- A term M that can reduce to normal form *has a normal form* or is *normalisable*.
- A term M that has no infinite reduction sequences is said to be *strongly normalisable*.

Reduction and Conversion

- $P \triangleright^0 Q$ just if $P = Q$.
- $P \triangleright^{k+1} Q$ just if there is some U such that $P \triangleright^k U$ and $U \triangleright Q$.

Define $M \triangleright^* N$ just if there is some n such that $M \triangleright^n N$.

We write $M \approx N$ just if there is a term P such that $M \triangleright^* P$ and $N \triangleright^* P$.

Type Assignment

$$(\text{Types}) \quad A, B ::= \text{Nat} \mid a \mid (A \rightarrow B)$$

Let \mathbb{C} be the following collection of type assignments:

$$\begin{aligned} & \{Z : \text{Nat}\} \cup \{S : \text{Nat} \rightarrow \text{Nat}\} \cup \{\text{pred} : \text{Nat} \rightarrow \text{Nat}\} \\ & \cup \{\text{ifz} : \text{Nat} \rightarrow A \rightarrow A \rightarrow A \mid A \in \mathbb{T}\} \\ & \cup \{\text{fix} : (A \rightarrow A) \rightarrow A \mid A \in \mathbb{T}\} \end{aligned}$$

The typing rules are:

$$\begin{aligned} & x:A \in \Gamma \frac{}{\Gamma \vdash x : A} (\text{TVar}) \quad c:A \in \mathbb{C} \frac{}{\Gamma \vdash c : A} (\text{TCst}) \\ & \frac{\Gamma \vdash M : B \rightarrow A \quad \Gamma \vdash N : B}{\Gamma \vdash MN : A} (\text{TApp}) \quad x \notin \text{dom } \Gamma \frac{\Gamma \cup \{x : B\} \vdash M : A}{\Gamma \vdash \lambda x. M : B \rightarrow A} (\text{TAbs}) \end{aligned}$$

We say that a closed term M is *typable* just if there is some type A such that $\vdash M : A$ is derivable in the type system. The *pure-term inhabitation problem*, is the problem of, given a type A , determining if there a closed *pure* term M such that $\vdash M : A$. In such a case, M is said to be an *inhabitant* of A .
