

TYPES AND λ -CALCULUS

Problem Sheet 4

- * 1. Justify each of the following conversions $M \approx N$ by finding a common reduct P , i.e. such that $M \triangleright^* P$ and $N \triangleright^* P$.
- (a) $(\lambda x. x)y \approx (\lambda x y. x) y z$
 - (b) $(\lambda x. M)N \approx M[N/x]$
 - (c) $\text{fix } (\underline{\text{const}} \ 1) \approx M (\underline{\text{const}} \ \text{pred } 2)$
 - (d) $z (\underline{\text{const}} \ \underline{\text{id}} \ \underline{\text{div}}) \ \underline{\text{div}} \approx z \ \underline{\text{id}} (\underline{\text{const}} \ \underline{\text{div}} \ \underline{\text{id}})$

- * 2. Define $\underline{Y} = \lambda f. (\lambda x. f (x x))(\lambda x. f (x x))$.

Show that \underline{Y} is also a fixed point combinator, i.e for all terms M :

$$\underline{Y}M \approx M(\underline{Y}M)$$

3. Prove Lemma 7.1 of the notes, i.e. show all of the following:

Reflexivity For all M : $M \approx M$.

Symmetry For all M, N : $M \approx N$ implies $N \approx M$.

Transitivity For all M, N and P : $M \approx P$ and $P \approx N$ implies $M \approx N$.

Compatibility For all M, N and $C[\]$: if $M \approx N$ then $C[M] \approx C[N]$.

There is no need for any induction. For compatibility, you will need to use a result from the previous problem sheet.

Recall the definition of add:

$$\text{fix } (\lambda f x y. \text{ifz } x \ y \ (S \ (f \ (\text{pred } x) \ y))))$$

* 4. Give a complete reduction sequence from $\underline{\text{add}}\ \underline{2}\ \underline{3}$ to $\underline{5}$.

* 5. Prove that $\underline{\text{add}}$ satisfies the following equations:

$$\underline{\text{add}}\ \underline{0}\ \underline{m} \approx \underline{m} \quad \text{and} \quad \underline{\text{add}}\ (\underline{n+1})\ \underline{m} \approx \text{S}(\underline{\text{add}}\ \underline{n}\ \underline{m})$$

Hint: it will save time to first observe that (why?):

$$\underline{\text{add}} \approx \lambda x y. \text{ifz } x\ y\ (\text{S}(\underline{\text{add}}\ (\text{pred } x)\ y))$$

In practice, you nearly always want to replace an occurrence of $\underline{\text{add}}$ with the right-hand-side of this equation, rather than by its actual definition (and the same can be said for any recursive function defined using “the recipe”).

** 6. Use fix to define the recursive triangular number function: using the “recipe”, give a combinator $\underline{\text{Tri}}$ that satisfies:

$$\underline{\text{Tri}}\ \underline{0} \approx \underline{0} \quad \text{and} \quad \underline{\text{Tri}}\ (\underline{n+1}) \approx \underline{\text{add}}\ (\underline{n+1})\ (\underline{\text{Tri}}\ \underline{n})$$

Convince yourself that $\underline{\text{Tri}}\ \underline{2} \approx \underline{3}$ (this is obvious if you believe that your implementation of $\underline{\text{Tri}}$ really satisfies the given equations).

** 7. Define multiplication, i.e. construct a term $\underline{\text{mult}}$ that satisfies the following specification:

$$\underline{\text{mult}}\ \underline{0}\ \underline{m} \approx \underline{0} \quad \text{and} \quad \underline{\text{mult}}\ \underline{n+1}\ \underline{m} \approx \underline{\text{add}}\ \underline{m}\ (\underline{\text{mult}}\ \underline{n}\ \underline{m})$$

** 8. Prove that if $M \approx N$ and N is a normal form, then $M \triangleright^* N$.

Therefore, we now know that e.g. $\underline{\text{Tri}}\ \ulcorner 2 \urcorner \triangleright^* \ulcorner 3 \urcorner$, so these definitions actually *compute* an output given an input.

*** 9. Prove that there is no PCF term $\underline{\text{isNat}}$ that satisfies, for all terms M :

$$\underline{\text{isNat}}\ M \approx \begin{cases} \underline{1} & \text{if } M \text{ is a numeral, i.e. } \underline{n} \text{ for some } n \\ \underline{0} & \text{otherwise} \end{cases}$$
